Understanding the Microcontroller Based Street Light Control System

A microcontroller based street light control system integrates a microcontroller—an embedded computer that manages various sensors, switches, and communication modules—to automate the operation of street lights. Unlike traditional systems that turn lights on at sunset and off at sunrise, smart systems adapt their functioning based on real-time inputs, making them more energy-efficient and responsive.

This system typically includes components such as light sensors (LDRs), motion detectors, timers, communication modules, and power management units, all coordinated by the microcontroller to make intelligent decisions about when to turn lights on or off, dim, or switch to different modes.
