A transponder is an essential component onboard a satellite that receives signals from the ground station, amplifies them, shifts their frequency, and retransmits them back to the Earth. It acts as a relay station, enabling communication over vast distances. Key functions include:

- Frequency translation
- Signal amplification
- Filtering and switching

5. Describe the uplink and downlink in satellite communication.

Answer:

- Uplink: The communication link from the ground station (Earth station) to the satellite. It involves transmitting signals at a specific frequency to the satellite's transponder.
- Downlink: The transmission from the satellite back to the ground station, carrying the relayed signal.

Both links operate at different frequency bands to prevent interference, such as C-band, Ku-band, or Ka-band.
