Sample Titration Problem and Answer Key Breakdown

To illustrate, here's an example of a typical titration problem with its answer key components:

Problem Statement:

Determine the concentration of an unknown HCl solution by titrating it with a 0.1 M NaOH solution. The titration requires 25.0 mL of NaOH to reach the equivalence point.

Solution Steps:

- Write the balanced chemical equation:

\[

\]

- Calculate moles of NaOH:

\[

$$\text{Moles NaOH} = 0.1, \text{ mol/L} \times 0.025, \text{ L} = 2.5 \times 10^{-3}, \text{ mol}$$

\]

- Since the molar ratio is 1:1, moles of HCl = moles of NaOH:

\[

$$\text{Moles HCl} = 2.5 \times 10^{-3} \text{ mol}$$

\]

- Find the concentration of HCl:

\[

$$\text{Concentration} = \frac{\text{Moles}}{\text{Volume in Liters}} = \frac{2.5 \times 10^{-3}}{0.020 \text{ L}} = 0.125 \text{ M}$$

\]

Graphical Analysis:

- The titration curve shows a steep rise in pH near the equivalence point.
- The equivalence point corresponds to the volume where the steepest slope occurs, confirming the titrant volume used.

Question What is the main purpose of an acid-base titration simulation lab? The main purpose is to practice and understand the process of titrating acids and bases to determine unknown concentrations and to learn about proper titration techniques without using real chemicals. **Answer** How do you identify the endpoint in a titration simulation? In the simulation, the endpoint is typically

indicated by a color change in the solution, which corresponds to reaching the equivalence point where the acid and base are neutralized. What role does the indicator play in the titration simulation? The indicator provides a visual signal—usually a color change—that helps you determine when the titration has reached the endpoint, indicating that neutralization is complete. How can you calculate the concentration of an unknown acid or base using the simulation? By recording the volume of titrant used to reach the endpoint and knowing its concentration, you can apply the titration formula to calculate the unknown concentration of the analyte. What are common indicators used in acid-base titrations in the simulation? Common indicators include phenolphthalein and methyl orange, which change color at different pH levels suitable for various titration types. Why is it important to perform multiple titrations in the simulation? Performing multiple titrations ensures accuracy and allows you to calculate an average volume, reducing errors and increasing confidence in your results. How does the simulation help in understanding the concept of molarity and equivalence point? The simulation visually demonstrates how the molarity of titrant relates to the amount of acid or base in the solution and shows precisely where the equivalence point occurs during titration. Can the simulation be used to practice titration techniques like slow addition and mixing? Why is this important? Yes, the simulation allows you to practice controlled addition and proper mixing, which are crucial for accurate titrations in real laboratory settings to avoid overshooting the endpoint. What are some common mistakes to avoid when using the acid-base titration simulation? Common mistakes include adding titrant too quickly near the endpoint, not swirling the solution properly, misreading the indicator color change, and failing to record accurate measurements.

Sample Titration Problem with Answer Explanation

Problem Statement

A student titrates 25.0 mL of hydrochloric acid (HCl) with a sodium hydroxide (NaOH) solution. It takes 30.0 mL of NaOH to reach the endpoint. The molarity of NaOH is 0.150 M. What is the molarity of the HCl solution?

Step-by-Step Solution

- **Write the balanced chemical equation:**

- **Identify known values:**

- Volume of acid (V_1): 25.0 mL
- Volume of base (V_2): 30.0 mL
- Molarity of base (M_2): 0.150 M

- **Convert volumes to liters for calculations:**

- $V_1 = 0.025 \text{ L}$
- $V_2 = 0.030 \text{ L}$

- **Calculate moles of NaOH (titrant):**

$$n_{\text{NaOH}} = M_2 \times V_2$$

$$n_{\text{NaOH}} = 0.150 \text{ mol/L} \times 0.030 \text{ L} = 4.5 \times 10^{-3} \text{ mol}$$

\]

- **Determine moles of HCl (analyte):**

- From the balanced equation, the molar ratio is 1:1, so moles of HCl = moles of NaOH = 4.5×10^{-3} mol

- **Calculate molarity of HCl:**

\[

$$M_1 = \frac{\text{moles of HCl}}{V_1} = \frac{4.5 \times 10^{-3}}{0.025} = 0.18 \text{ M}$$

\]

Final Answer

The molarity of the hydrochloric acid solution is 0.18 M.
