Deep Dive into the 2018 CCP Mines Centrale Polytechnique MAT Problems

Core Themes and Topics Covered

The 2018 MAT problems revolved around several core mathematical themes:

- Algebra and Polynomial Equations: Roots, factorization, and properties of polynomials.
- Calculus: Derivatives, integrals, and their applications.
- Analysis: Series, sequences, and limits.
- Geometry: Vector calculus, coordinate transformations, and geometric loci.
- Probability and Statistics: Basic probability calculations and combinatorial reasoning.

Understanding these themes is crucial for tackling the exam effectively. Let's explore some representative problems and their solutions.

Analyzing Key Problems from the 2018 CCP MAT

Problem 1: Polynomial Root Analysis

Statement:

Given a polynomial $P(x) = x^4 + ax^3 + bx^2 + cx + d$ with real coefficients, and knowing that $P(x)$ has two real roots r_1 and r_2 such that $r_1 + r_2 = 3$ and $r_1 r_2 = 2$. Find the possible values of (a, b, c, d) .

Detailed Solution Approach:

- Recognize that the roots r_1, r_2 are associated with factors $(x - r_1)$ and $(x - r_2)$.
- The polynomial can be factored as:

$$P(x) = (x^2 + p x + q)(x^2 + s x + t)$$

where the roots of each quadratic correspond to the roots of $P(x)$.

- Given the sum and product of (r_1, r_2) :

$$r_1 + r_2 = 3 \rightarrow \text{sum of roots of first quadratic} = -p$$

$$r_1 r_2 = 2 \rightarrow \text{product of roots} = q$$

- Therefore, the first quadratic is:

$$x^2 - (r_1 + r_2) x + r_1 r_2 = x^2 - 3 x + 2$$

- The second quadratic's roots depend on the remaining roots, possibly complex or real, but the problem specifies only the two roots with known sums and products, suggesting the other roots are not specified.

- To find (a, b, c, d) , expand the factorization:

$$[$$

$$P(x) = (x^2 - 3x + 2)(x^2 + sx + t)$$

\]

- Expanding:

\[

$$P(x) = x^4 + sx^3 + tx^2 - 3x^3 - 3sx^2 - 3tx + 2x^2 + 2sx + 2t$$

\]

- Combine like terms:

\[

$$P(x) = x^4 + (s - 3)x^3 + (t - 3s + 2)x^2 + (-3t + 2s)x + 2t$$

\]

- From here, identify:

\[

$$a = s - 3$$

\]

\[

$$b = t - 3s + 2$$

\]

\[

$$c = -3t + 2s$$

$$\backslash]$$

$$\backslash[$$

$$d = 2 t$$

$$\backslash]$$

- Since $\backslash(s \backslash)$ and $\backslash(t \backslash)$ are parameters, the set of all possible coefficients $\backslash(a, b, c, d) \backslash)$ can be described in terms of $\backslash(s, t \backslash)$.

Key Takeaway:

This problem illustrates how known root sums and products can guide polynomial factorization, and how parameters influence the coefficients.

Problem 2: Calculus and Optimization

Statement:

Consider the function $\backslash(f(x) = x^3 - 6 x^2 + 9 x + 2 \backslash)$. Determine its local extrema and classify them.

Solution Steps:

- Compute the derivative:

$$\backslash[$$

$$f'(x) = 3 x^2 - 12 x + 9$$

$$\backslash]$$

- Find critical points:

$$\backslash[$$

$$3 x^2 - 12 x + 9 = 0$$

]

[

$$x^2 - 4x + 3 = 0$$

]

[

$$(x - 1)(x - 3) = 0$$

]

- Critical points at $x = 1$ and $x = 3$.

- Determine the nature of each critical point via second derivative:

[

$$f''(x) = 6x - 12$$

]

- At $x=1$:

[

$$f''(1) = 6 - 12 = -6$$

]

- At $x=3$:

[

$$f''(3) = 18 - 12 = 6 > 0 \Rightarrow \text{local minimum.}$$

- Find the extremal values:

$\backslash$

$$f(1) = 1 - 6 + 9 + 2 = 6$$

$\backslash$

$\backslash$

$$f(3) = 27 - 54 + 27 + 2 = 2$$

$\backslash$

Conclusion:

The function has a local maximum at $(x=1)$ with value 6, and a local minimum at $(x=3)$ with value 2.
