Common Review Questions and Their Answers

Below are some typical questions from Biology Spring Packet 2, along with detailed answers to enhance understanding.

1. What are the main functions of the cell membrane?

Answer:

The cell membrane, also known as the plasma membrane, primarily functions to:

- Protect the cell by acting as a barrier.
- Regulate transport of substances in and out of the cell through selective permeability.
- Facilitate communication with the environment via receptor proteins.
- Support cell adhesion and interaction with other cells.

The membrane is composed mainly of a phospholipid bilayer with embedded proteins, cholesterol, and carbohydrate chains that aid in communication and transport.

2. Explain the difference between mitosis and meiosis.

Answer:

- Mitosis is a process of cell division that results in two genetically identical diploid daughter cells,

essential for growth, tissue repair, and asexual reproduction.

- Meiosis is a specialized form of cell division that produces haploid gametes (sperm and eggs) with half the genetic material, enabling sexual reproduction. It involves two rounds of division, leading to four genetically diverse haploid cells.

Key differences include:

- Number of divisions (1 in mitosis, 2 in meiosis)
- Genetic variation (mitosis produces clones, meiosis introduces diversity)
- Chromosome number (diploid vs. haploid)

3. Describe the process of DNA replication.

Answer:

DNA replication is a semi-conservative process where each original strand serves as a template for new complementary strands. The process involves:

- Initiation: Enzymes like helicase unwind the DNA double helix.
- Elongation: DNA polymerase adds nucleotides to the new strands in the 5' to 3' direction, following base pairing rules (A-T, G-C).
- Termination: Replication forks meet, and the result is two identical DNA molecules, each with one old and one new strand.

This process is essential for cell division, ensuring genetic information is accurately transmitted.

4. How does natural selection lead to evolution?

Answer:

Natural selection is a mechanism of evolution where:

- Individuals with advantageous traits are more likely to survive and reproduce.
- These traits become more common in the population over generations.
- Environmental pressures influence which traits are favorable.
- Over time, populations adapt to their environments, leading to evolutionary change.

Key components include variation, differential survival, and reproduction.

5. What roles do producers, consumers, and decomposers play in an ecosystem?

Answer:

- Producers (like plants and algae) create energy-rich organic compounds through photosynthesis, forming the base of the food chain.
- Consumers (herbivores, carnivores, omnivores) consume producers or other consumers to obtain energy.
- Decomposers (fungi, bacteria) break down dead organic material, recycling nutrients back into the environment.

Together, these roles maintain ecosystem stability and nutrient cycling.
