Designing the Circuit Diagram: A Step-by-Step Approach

Constructing an effective circuit diagram involves integrating the above components logically. Here's a detailed breakdown:

1. Sensor Integration and Input Circuitry

Sensors are the primary data sources, providing real-time information to the PLC.

a. Vehicle Detection

- Inductive Proximity Sensors are installed at entry points and parking spots.
- When a vehicle approaches or enters, the sensor outputs a HIGH (ON) signal.
- The sensor's output is connected to a dedicated PLC input terminal (e.g., I0.0).

b. Position Confirmation

- Limit switches placed on moving components (ramps, lifts) confirm their positions.
- These switches send signals to PLC inputs (e.g., I0.1, I0.2).

c. Obstacle Detection

- IR sensors detect obstacles during movement, ensuring safety.
- Connected similarly to PLC input modules.

Input Circuit Considerations:

- Use current-limiting resistors (e.g., 10k Ω) for sensor outputs.
- Incorporate diodes if sensors are inductive, to suppress voltage spikes.
- Opt for NC (Normally Closed) sensors where possible, for fail-safe operation.

2. Output Circuitry for Actuator Control

Outputs from the PLC control various actuators.

a. Motor Control

- Relay or Solid-State Relays (SSRs) are used to switch high-current motors.
- The PLC output (e.g., Q0.0 for platform movement) energizes relays, which then supply power to motors.

b. Hydraulic/Pneumatic Actuators

- Controlled via solenoid valves activated through relays.
- Proper flyback diodes are essential across relay coils to prevent voltage spikes.

c. Mechanical Locks and Doors

- Solenoids or motorized locks are controlled via PLC outputs for safety and security.

Output Circuit Considerations:

- Use appropriate contact ratings matching actuator requirements.
- Implement overcurrent protection (fuses or circuit breakers).

3. Power Supply and Safety Circuits

- A dedicated 24V DC power supply is typical for sensors and PLC logic.
- Isolation circuits are recommended to prevent electrical noise.
- Emergency stop buttons are wired in normally closed configuration, wired in series with power supply lines to immediately cut power upon activation.

4. Control Logic Programming

The core of the circuit diagram lies in the PLC's control logic:

- Sequential operations: Vehicle detection ? parking space selection ? movement initiation ? parking execution ? confirmation.
- Safety interlocks: Prevent simultaneous movements or collisions.
- Error handling: Detect faults and alert the operator via HMI.

Using ladder logic, the PLC program orchestrates these functions, translating input signals into controlled output actions.

5. Overall Circuit Diagram Structure

The complete circuit diagram integrates all components:

- Input section: Sensors connected to PLC input modules.

- Processing section: PLC CPU executing the control program.
- Output section: PLC outputs controlling relays, motors, solenoids.
- Power section: Power supplies and safety devices.
- Human Interface: HMI panels and emergency controls.

This interconnected system ensures smooth, safe, and reliable parking automation.

Working Principle of the System

Once the circuit diagram is established, the system operates as follows:

- Vehicle Entry Detection
 - The inductive sensor detects the incoming vehicle and signals the PLC.
 - PLC verifies parking space availability via sensors.
- Parking Space Selection
 - The control logic selects the nearest available spot.
 - The system confirms the spot via limit switches.
- Automated Parking Maneuver
 - The PLC activates motors and actuators to move the vehicle onto the parking platform.
 - Ramps and lifts are coordinated to position the vehicle accurately.
- Final Position Confirmation
 - Limit switches confirm the vehicle is parked correctly.
 - The system locks the parking spot, signaling completion.
- Vehicle Exit

- When the vehicle is to be retrieved, sensors detect its approach.

Applying the ITE Parking Generation Manual in Practice

Case Study: Commercial Development Parking Planning

Suppose a developer plans to build a regional shopping mall spanning 200,000 square feet. Using the ITE manual:

- Step 1: Identify the land use category ? Retail, Shopping Center.
- Step 2: Refer to the manual's data table for shopping centers, which might specify a parking generation rate of approximately 4.5 spaces per 1,000 square feet.
- Step 3: Calculate base parking demand:

$200 \times 4.5 = 900$ parking spaces.

- Step 4: Adjust for local factors (e.g., regional data suggests a higher demand of 5.0 spaces per 1,000 sq ft due to high retail activity).

New estimate: $200 \times 5.0 = 1,000$ spaces.

- Step 5: Determine peak demand, often occurring during weekends or holiday seasons; the manual provides peak factor adjustments to ensure sufficient capacity.

By following these steps, the developer can plan a parking facility that balances cost, convenience,

and land use efficiency.
