Core Components of a Machining Cost Calculation Excel Sheet

A comprehensive Excel sheet for machining cost calculation should encompass several interconnected modules, each addressing specific cost elements:

1. Material Costs

Material costs form the foundation of machining expenses. Key considerations include:

- Type and Grade of Material: Steel, aluminum, titanium, plastics, etc., each with different costs.
- Material Quantity: Based on the part's volume, weight, or dimensions.
- Unit Price: Cost per kilogram, meter, or piece, sourced from suppliers.

Implementation Tips:

- Incorporate a lookup table for material prices.

2. Machining Time Calculation

Accurately estimating machining time is critical for cost calculation. It involves:

- Cutting Time (T_c): Time taken for actual material removal.
- Setup Time (T_s): Time for machine preparation and tool setup.
- Tool Change Time: When multiple tools are involved.
- Idle and Non-productive Time: Machine waiting, inspection, or maintenance.

Methods to estimate machining time:

- Formula-Based Calculation:

Cutting Time (T_c):

$$T_c = (\text{Depth of Cut} \times \text{Feed Rate}) / \text{Feed per Tooth}$$

Or, for milling:

$$T_c = (\text{Part Surface Area} / \text{Cutting Speed}) \times \text{Machine Constant}$$

- Using Empirical Data: Based on historical data or manufacturer specifications.

Implementation Tips:

- Create input cells for parameters like feed rate, cutting speed, tool diameter.
- Use formulas to automate time calculations based on part geometry.

3. Machine Operating Costs

These costs include:

- Machine Wear and Tear: Depreciation.
- Electricity Consumption: Power used during operation.

$(\text{Purchase Price} - \text{Residual Value}) / \text{Useful Life (hours)}$

- Electricity:

$\text{Power Rating (kW)} \times \text{Operating Hours} \times \text{Cost per kWh}$

- Labor:

$\text{Operator wage rate} \times \text{Total machining hours}$

Implementation Tips:

- Use separate sheets or sections for each cost component.
